

MemoryVerse AI

Developed By: Dharshini.K

Project Type: AI-Powered Digital Identity System

Technology Stack: Python, Flask, HTML, CSS, JavaScript

Date: July 2026

Thought Process

Problem Statement

Students accumulate certificates, resumes, internship letters, project reports, and achievements over time. These documents are usually scattered across multiple folders and cloud storage, making them difficult to organize and retrieve.

Proposed Solution

MemoryVerse AI provides a centralized platform where users can upload their academic and professional documents. The system automatically categorizes documents, extracts relevant skills, builds relationships between achievements, and presents the user's journey through a digital timeline.

AI Approach

- Document Categorization
- Skill Extraction
- Relationship Mapping
- Smart Search
- Timeline Generation

Workflow

1. User uploads a document.
2. The document is categorized automatically.
3. Skills are extracted from the document.

4. Relationships are generated between skills and documents.
5. Documents are displayed in the dashboard, timeline, and search modules.

Technologies Used

- Python
- Flask
- HTML
- CSS
- JavaScript

Future Enhancements

- OCR support for scanned documents
- NLP-based document understanding
- Semantic search
- Vector database integration
- Cloud storage support

Conclusion

MemoryVerse AI simplifies digital document management by intelligently organizing information and enabling quick retrieval, helping users maintain a structured digital identity.
